

Dynamic Programming & Sequence Alignment

Florian Schoppmann

Computer Science for Solving Problems

“Directions from California Academy of
Sciences to Ferry Building?”

- Recurring problem
- Should have a “formula” or general scheme
- Need formal model!

model |'mäd|

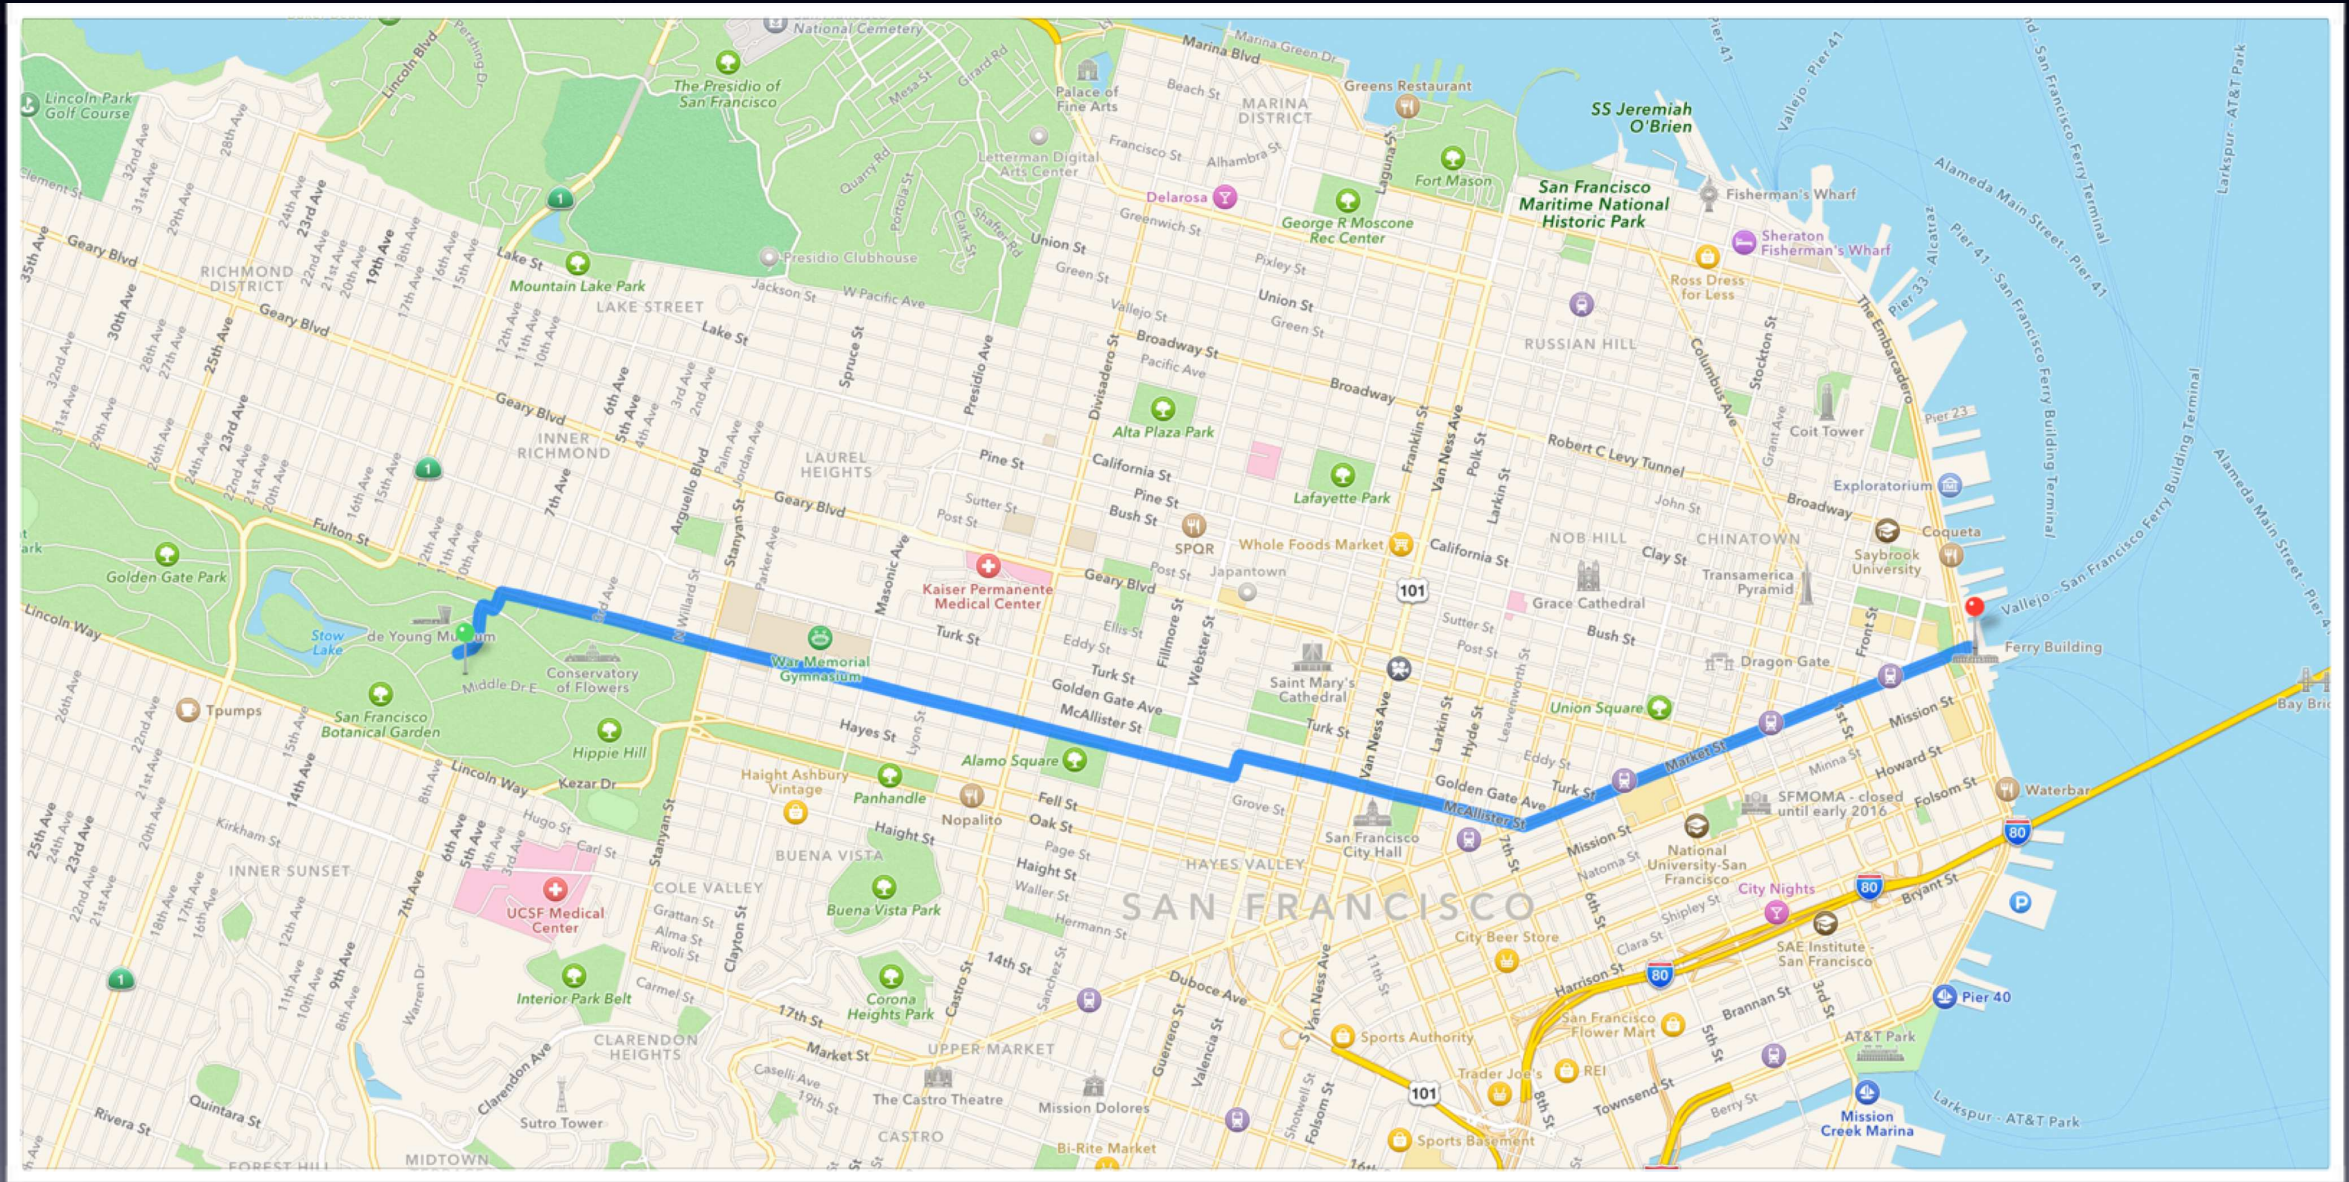

[...]

- a simplified description, especially a mathematical one, of a system or process, to assist calculations and predictions

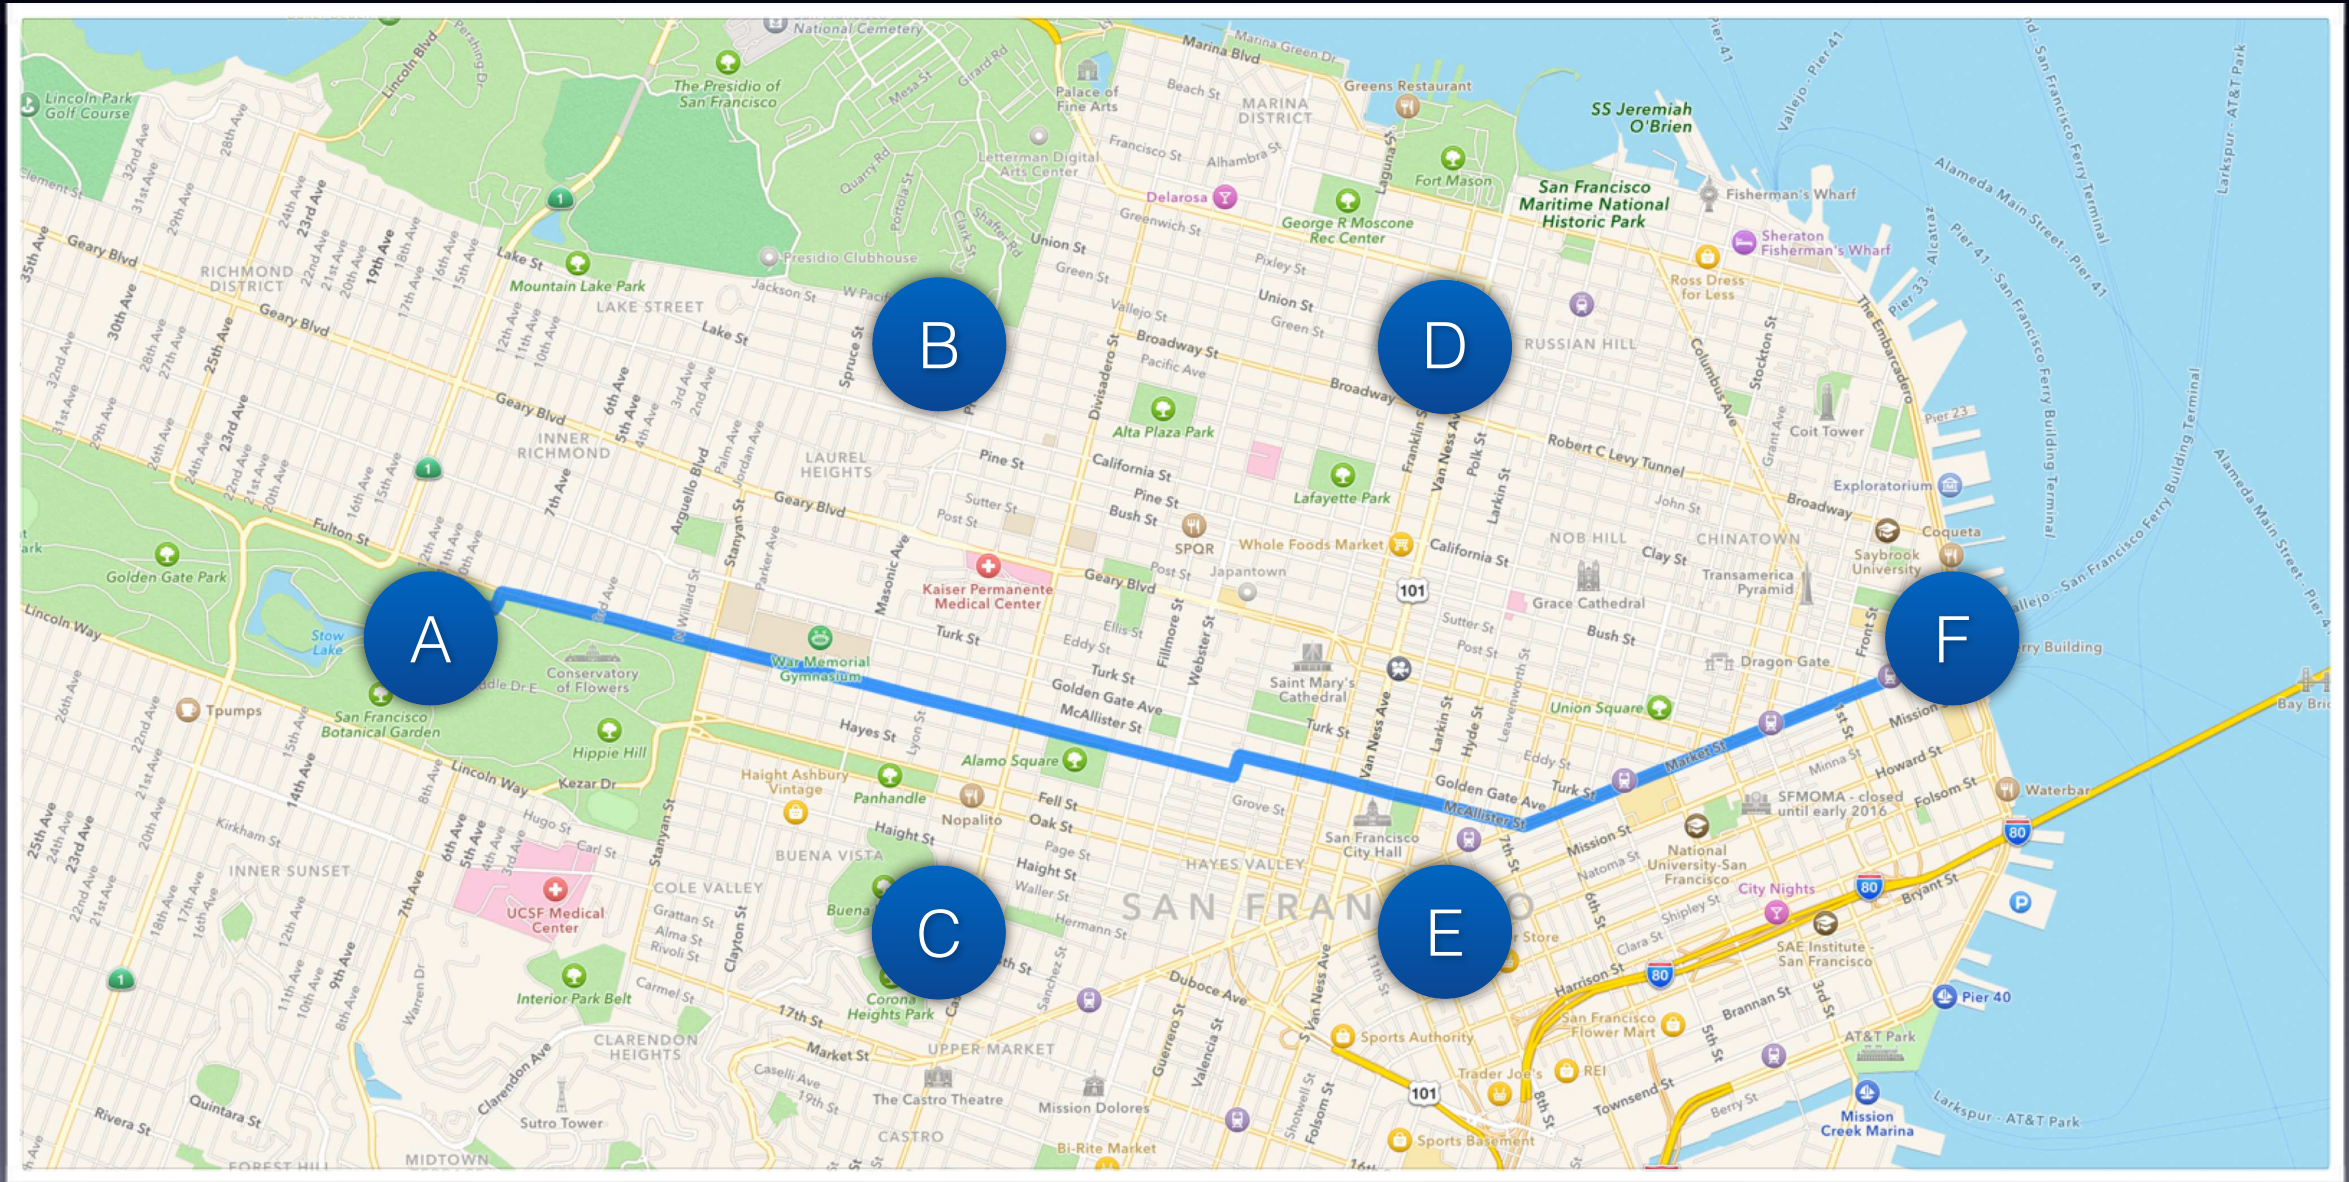

[...]

New Oxford American Dictionary

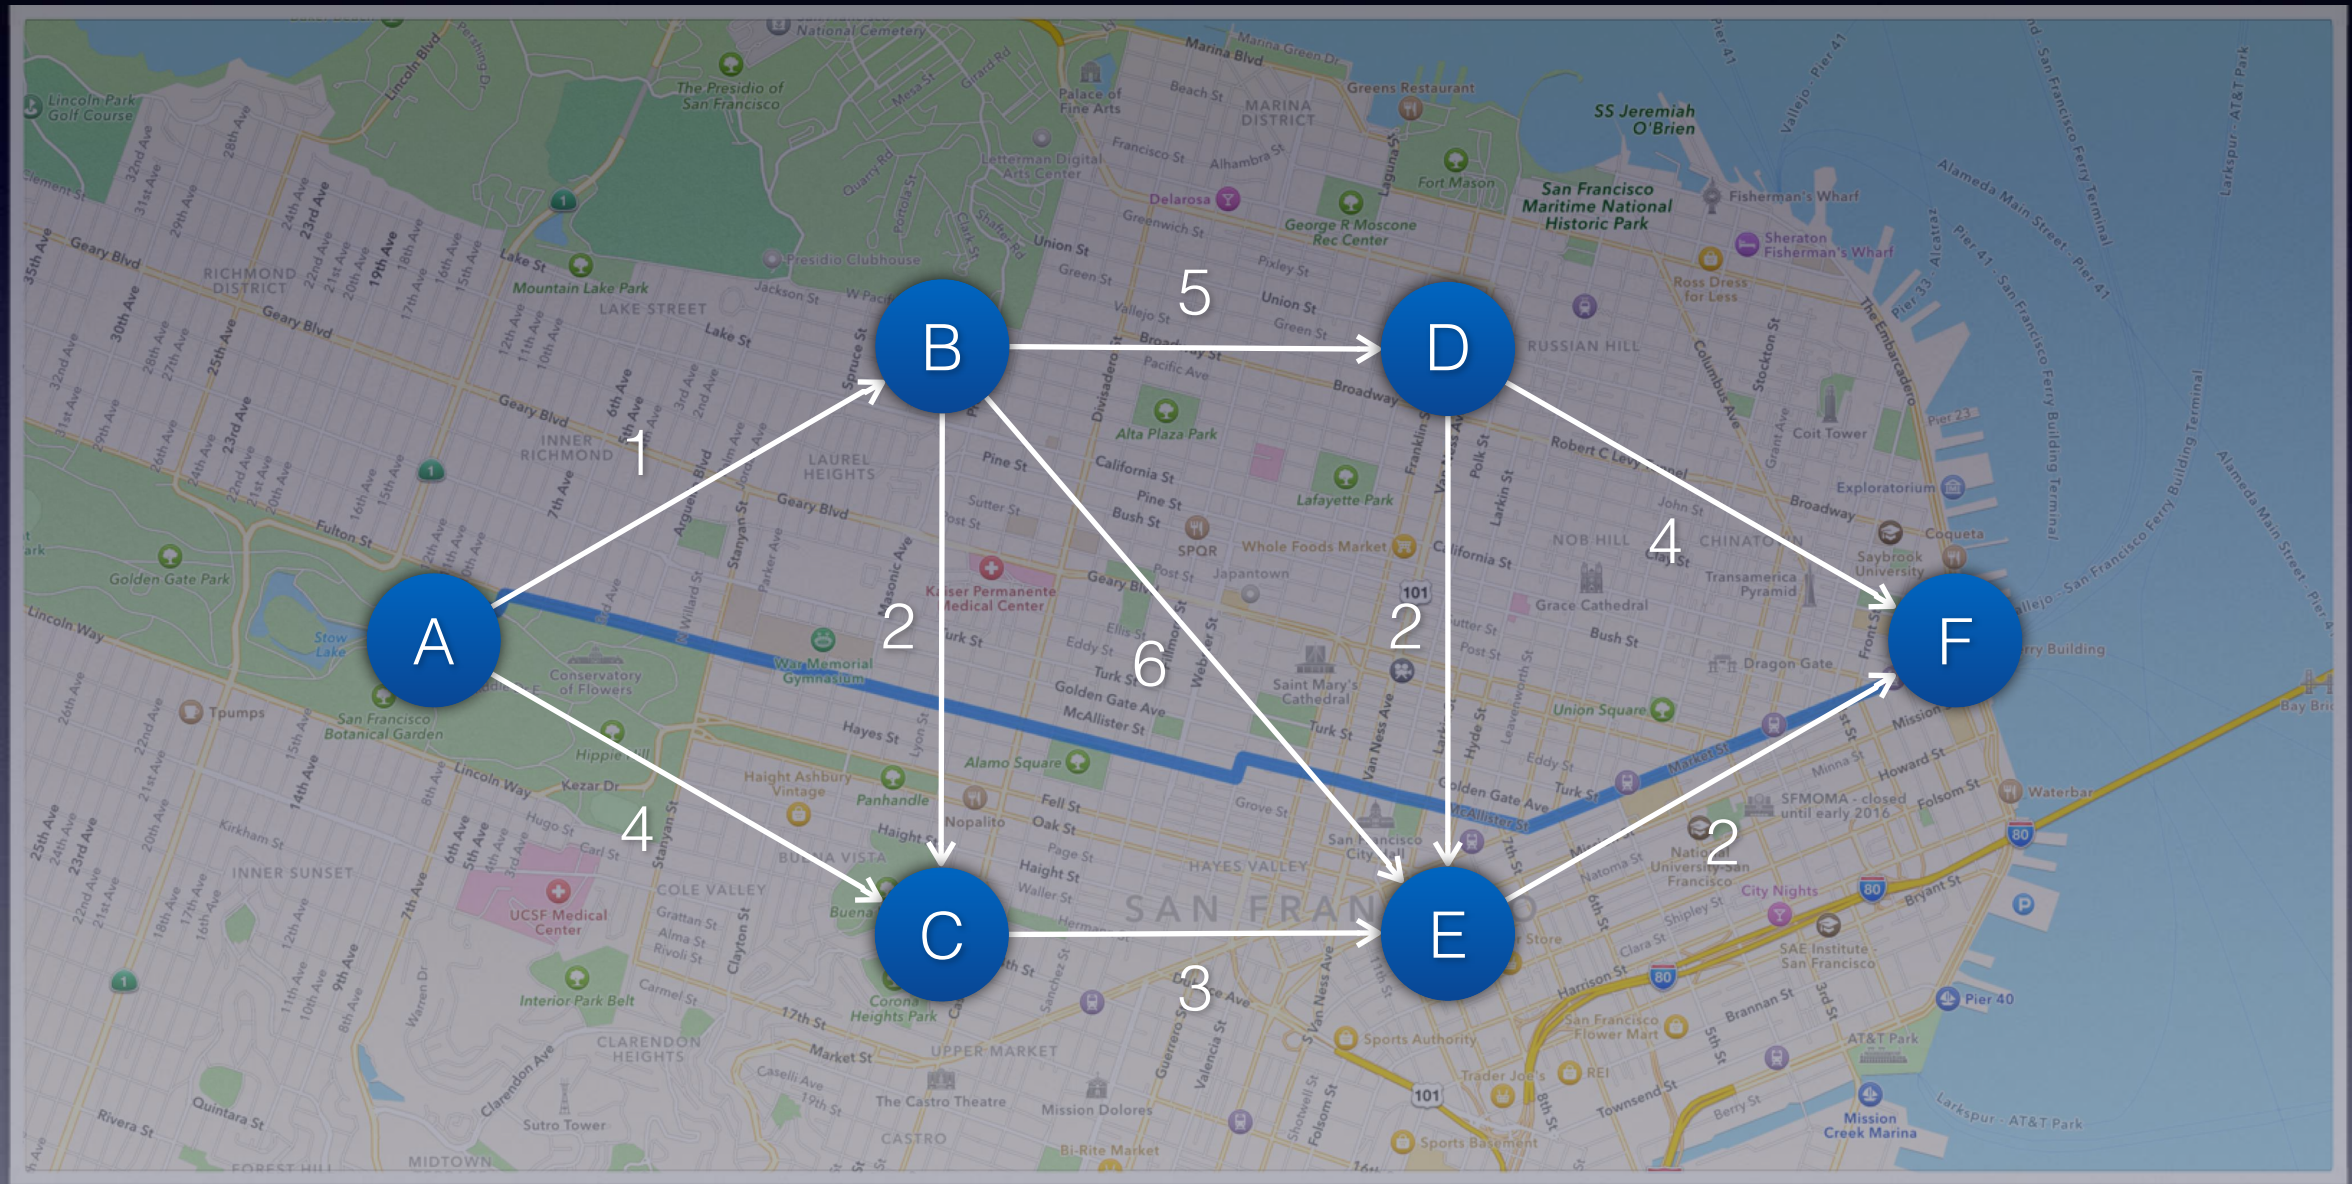

A Model for the Directions Problem

A Model for the Directions Problem

A Model for the Directions Problem

A Model for the Directions Problem

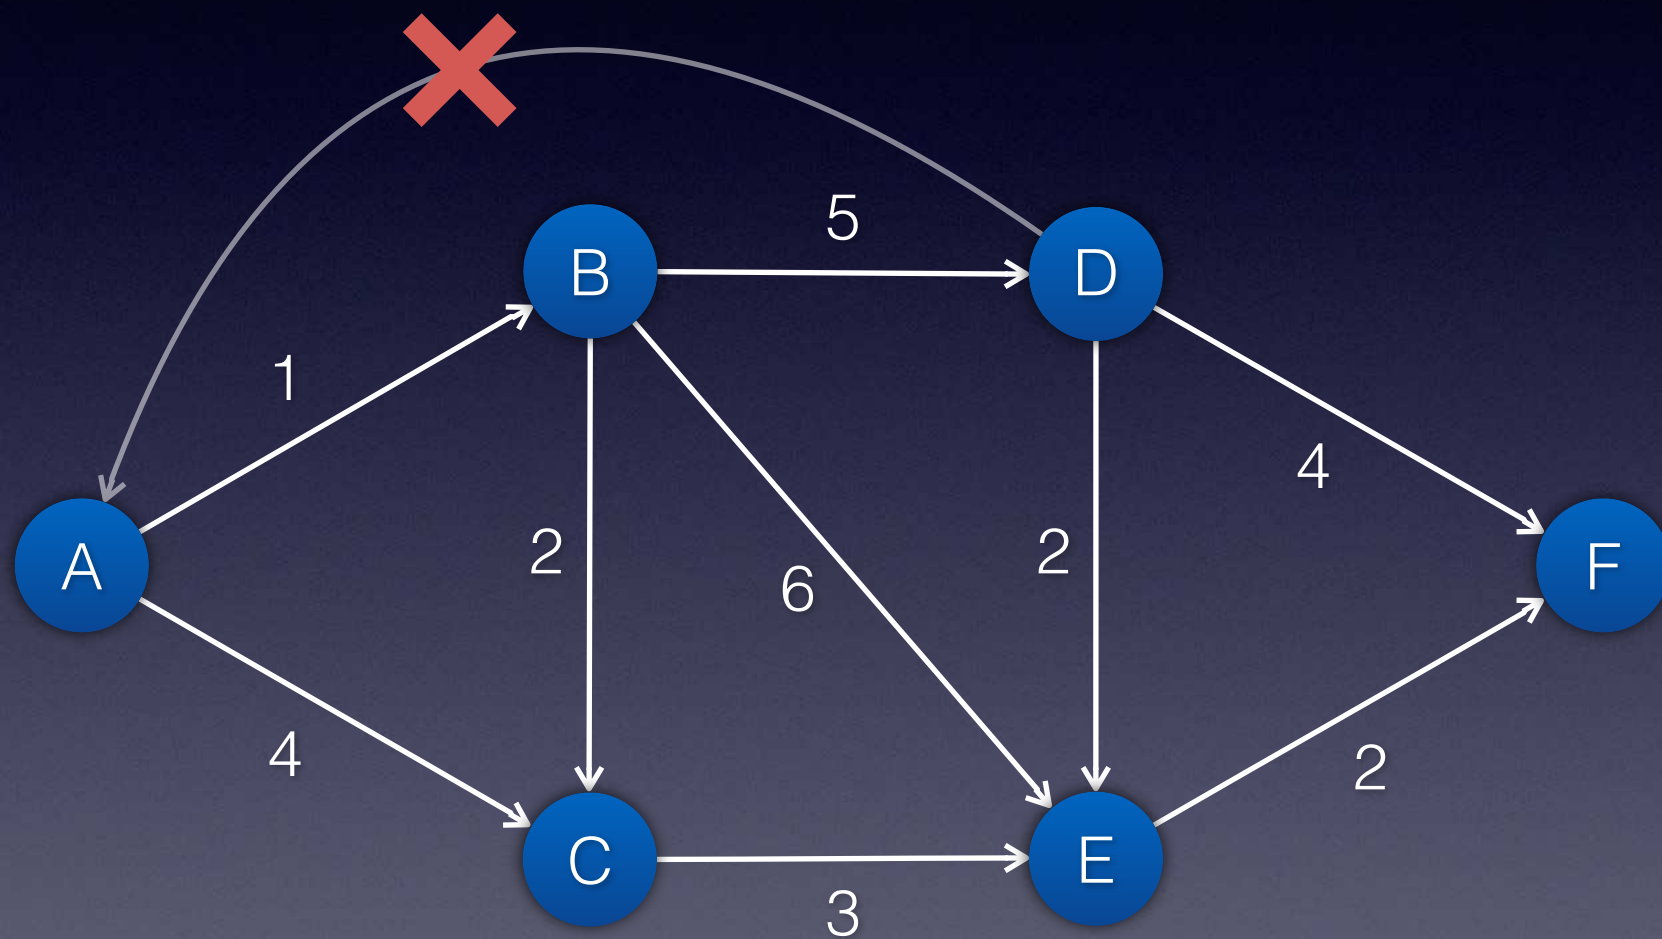

Directed Acyclic Graphs

graph $G = (V, E)$ where $E \subseteq V \times V$
edge-label function $c: E \rightarrow \{1, 2, \dots\}$

Directed Acyclic Graphs

graph $G = (V, E)$ where $E \subseteq V \times V$
edge-label function $c: E \rightarrow \{1, 2, \dots\}$

Linearizing DAGs

Can move vertices so that edges from left to right!

Linearizing DAGs

Can move vertices so that edges from left to right!

Subproblem Structure

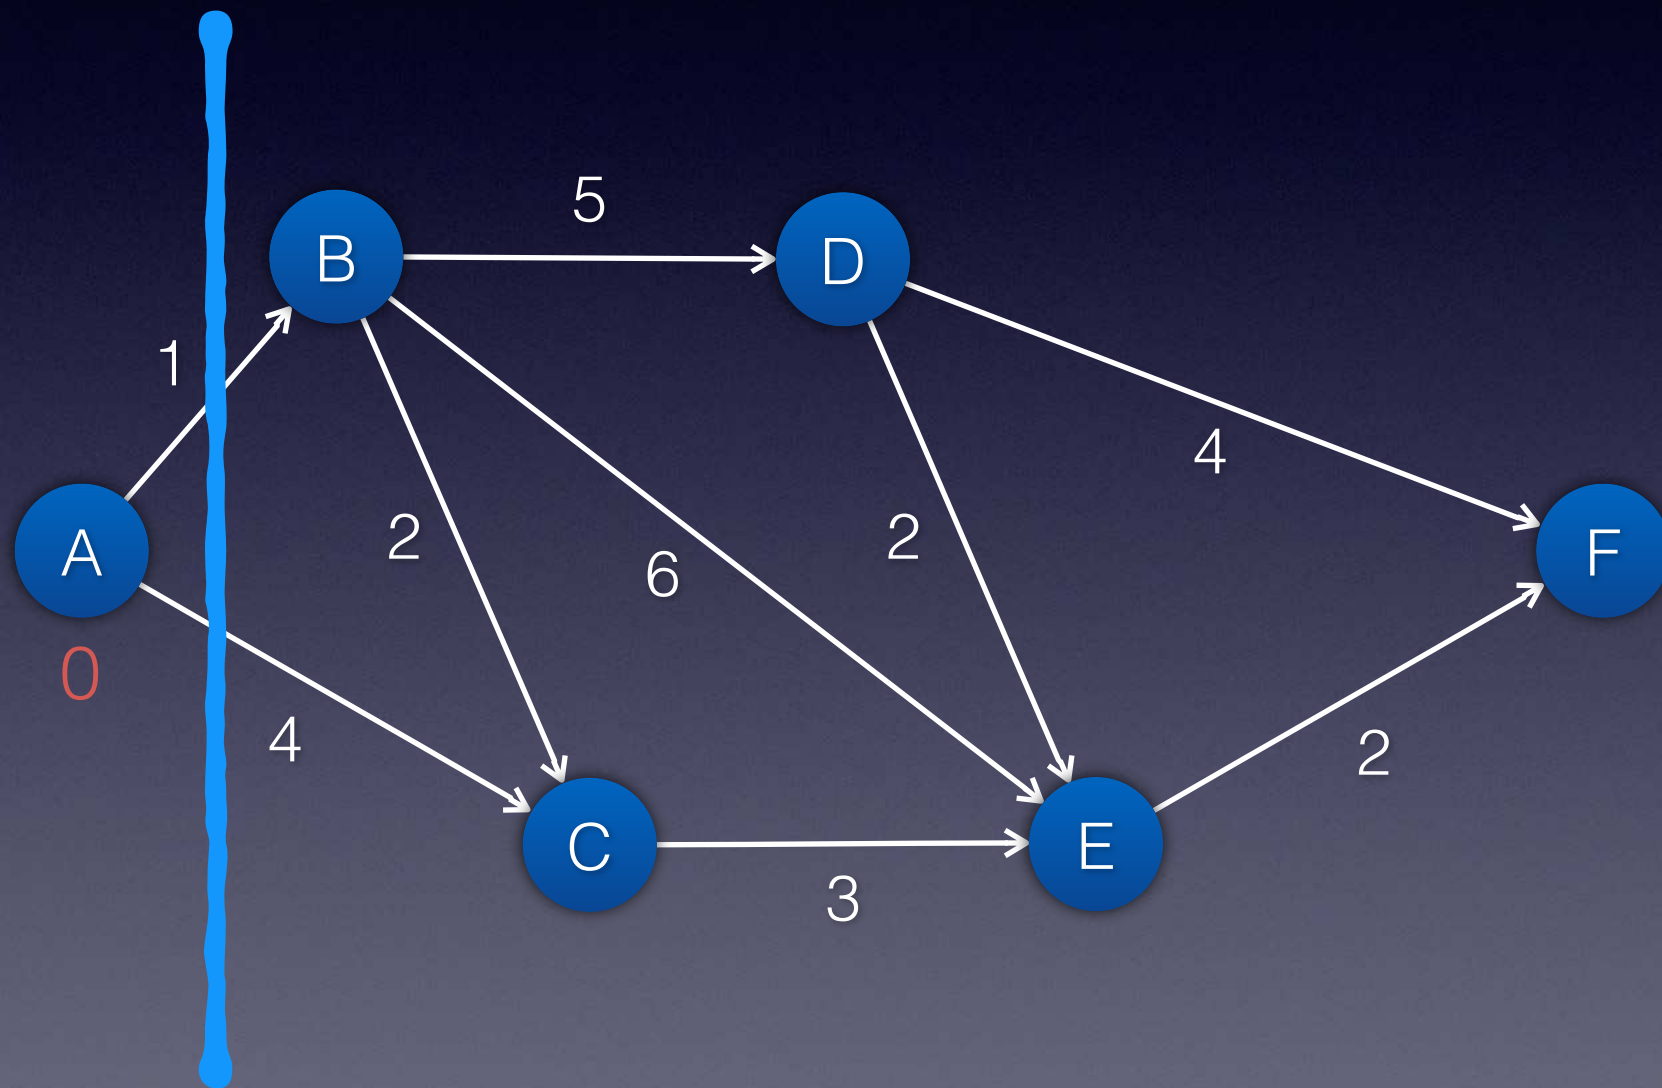

$$d(F) = \min\{d(D) + 4, d(E) + 2\}$$

A Dynamic Program for Shortest Paths

$$\forall v \in V \setminus \{A\} : d(v) = \min_{(u,v) \in E} \{d(u) + c(u, v)\}$$

A Dynamic Program for Shortest Paths

$$\forall v \in V \setminus \{A\} : d(v) = \min_{(u,v) \in E} \{d(u) + c(u, v)\}$$

A Dynamic Program for Shortest Paths

$$\forall v \in V \setminus \{A\} : d(v) = \min_{(u,v) \in E} \{d(u) + c(u, v)\}$$

A Dynamic Program for Shortest Paths

A Dynamic Program for Shortest Paths

$$\forall v \in V \setminus \{A\} : d(v) = \min_{(u,v) \in E} \{d(u) + c(u, v)\}$$

A Dynamic Program for Shortest Paths

$$\forall v \in V \setminus \{A\} : d(v) = \min_{(u,v) \in E} \{d(u) + c(u, v)\}$$

Subproblem DAG

- Vertex \approx (optimization) problem
- Predecessor vertex \approx subproblem
 - “Acyclic” is crucial
 - Subproblems may overlap
- Optimal solution for one vertex induces optimal solution for at least one predecessor
- “Bottom-up”: Progressively larger problems

Fibonacci Numbers

$$F_n = F_{n-1} + F_{n-2}$$

$$F_1 = 1 \text{ and } F_0 = 0$$

Fibonacci Numbers

$$F_n = F_{n-1} + F_{n-2}$$

$$F_1 = 1 \text{ and } F_0 = 0$$

Example: Genealogical tree of male bee

“Top-Down” Recursion

$$F_n = F_{n-1} + F_{n-2}$$

$$F_1 = 1 \text{ and } F_0 = 0$$

This Java code is excruciatingly slow! Why?

```
long fib(int n) {  
    if (n == 0) {  
        return 0;  
    } else if (n == 1) {  
        return 1;  
    } else {  
        return fib(n - 1) + fib(n - 2);  
    }  
}
```

“Bottom-up” Dynamic Program

- Subproblem DAG is implicit
- Operation on subproblem results is just addition

“Bottom-up” Dynamic Program

- Subproblem DAG is implicit
- Operation on subproblem results is just addition

“Bottom-up” Dynamic Program

“Bottom-up” Dynamic Program

- Subproblem DAG is implicit
- Operation on subproblem results is just addition

“Bottom-up” Dynamic Program

- Subproblem DAG is implicit
- Operation on subproblem results is just addition

Dynamic Programming

- Term coined by Richard Bellman in the 1950s
- Programming \approx planning over time
- Secretary of Defense hostile to mathematical research

[...] it's impossible to use the word **dynamic** in a pejorative sense. [...] It was something not even a Congressman could object to. [...]

Eye of the Hurricane, An Autobiography (1984)

Edit Distance

- Measure for dissimilarity of two character strings
- Intuitive: minimum number of elementary edit operations (insert, delete, replace)
- Can represent as alignment

t	h	e
t	e	a

t	h	e	—
t	—	e	a

t	h	e	—	—	—
—	—	—	t	e	a

- Edit distance between “the” and “tea” = 2

Formal Problem Definition

- Input: Sequences $x[1..n]$ and $y[1..m]$

x_1	x_2	\dots	x_n
-------	-------	---------	-------

y_1	y_2	\dots	y_m
-------	-------	---------	-------

- Output: length d of a minimum-length alignment
(note: $0 \leq n + m \leq d$)

Where is the Subproblem DAG?

Only three alignments of $x[1..n]$ and $y[1..m]$

$x[1..n-1]$	$x[n]$
$y[1..m-1]$	$y[m]$

$x[1..n-1]$	$x[n]$
$y[1..m]$	–

$n-1$ n

$x[1..n]$	–
$y[1..m-1]$	$y[m]$

Recall: Optimal Substructure

- Let u be predecessor (subproblem) of v
- $d(v) = d(u) + c(u, v)$
 $\Leftrightarrow u$ on shortest path from A to v

Edit Distance Has Optimal Substructure

An optimal alignment has optimal sub-alignments

t	h	e
t	e	a

t	h
t	e

e
a

$$d(3,3) = d(2,2) + \text{diff}(x[3], y[3])$$

A Dynamic Program for Edit Distance

$x[1 \dots n-1]$	$x[n]$
$y[1 \dots m-1]$	$y[m]$

$x[1 \dots n-1]$	$x[n]$
$y[1 \dots m]$	–

$x[1 \dots n]$	–
$y[1 \dots m-1]$	$y[m]$

$$d(i, 0) = i \quad \text{and} \quad d(0, j) = j$$

$$d(n, m) = \min \left\{ \begin{array}{l} d(n-1, m) + 1, \\ d(n, m-1) + 1, \\ d(n-1, m-1) + \text{diff}(x[n], y[m]) \end{array} \right\}$$

Example

		t	h	e
	0 → 1 → 2 → 3			
t	↓ 1			
e	↓ 2			
a	↓ 3			

Example

	t
	t

	t
	—

	—
	t

		t	h	e
	0 → 1 → 2 → 3			
t	↓ 1			
e	↓ 2			
a	↓ 3			

Example

t	h
-	t

t	h
t	-

t	h	-
-	-	t

		t	h	e
	0 → 1 → 2 → 3			
t	1	0		
e	2			
a	3			

Example

		t	h	e
	0	→ 1	→ 2	→ 3
t	1	0	→ 1	
e	2			
a	3			

Example

		t	h	e
	0	→ 1	→ 2	→ 3
t	1	0	→ 1	→ 2
e	2			
a	3			

Example

		t	h	e
	0	→ 1	→ 2	→ 3
t	↓ 1	0	→ 1	→ 2
e	↓ 2	↓ 1		
a	↓ 3			

Example

		t	h	e
	0	1	2	3
t	1	0	1	2
e	2	1	1	
a	3			

The diagram illustrates a sequence of moves on a 5x5 grid. The grid contains letters 't', 'h', 'e' and numbers 0-3. Arrows indicate a path: 0 (row 1, col 2) to 1 (row 2, col 3) to 2 (row 3, col 4) to 3 (row 4, col 5). A green arrow points from 0 to 1, and another green arrow points from 1 to 2. A red arrow points from 2 to 3. A white arrow points from 0 to 1, and a black arrow points from 1 to 2.

Example

		t	h	e
	0	1	2	3
t	1	0	1	2
e	2	1	1	1
a	3			

The diagram illustrates the calculation of edit distance between the words "the" and "tea". The grid shows the edit distance for prefixes of "t", "h", "e", and "a". The values are as follows:

- Row 1 (Prefixes): 0, 1, 2, 3
- Row 2 (t): 1, 0, 1, 2
- Row 3 (e): 2, 1, 1, 1
- Row 4 (a): 3

Arrows indicate the sequence of operations:

- Green arrows (Insertions): 0 → 1, 1 → 2, 2 → 3
- Orange arrows (Deletions): 1 → 0, 2 → 1, 3 → 2
- White arrows (Substitutions): 0 → 1, 1 → 2, 2 → 3
- Red arrow: 1 → 1 (from e to t)

Example

		t	h	e
	0	1	2	3
t	1	0	1	2
e	2	1	1	1
a	3	2		

The diagram illustrates the calculation of edit distance between the words "the" and "thea". The grid shows the edit distance for prefixes of "t", "h", "e", and "a". The values are as follows:

- Row 1 (Prefixes of "t"): 0, 1, 2, 3
- Row 2 (Prefixes of "h"): 1, 0, 1, 2
- Row 3 (Prefixes of "e"): 2, 1, 1, 1
- Row 4 (Prefixes of "a"): 3, 2, ,

Arrows indicate the path of minimum cost:

- Orange arrows show the path from (0,0) to (1,0) to (2,0) to (3,0).
- Green arrows show the path from (1,0) to (1,1) to (1,2) to (1,3).
- White arrows show the path from (1,0) to (2,1) and from (2,1) to (3,2).
- A red arrow points from (2,1) to (3,1).

Example

		t	h	e
	0	1	2	3
t	1	0	1	2
e	2	1	1	1
a	3	2	2	

Example

		t	h	e
	0	1	2	3
t	1	0	1	2
e	2	1	1	1
a	3	2	2	2

The diagram illustrates a 5x5 grid with letters and numbers. The grid is defined by the following structure:

- Columns: The first column is empty. The second column contains 't', 'h', 'e'. The third column contains 't', 'e', 'a'.
- Rows: The first row is empty. The second row contains '0', '1', '2', '3'. The third row contains '1', '0', '1', '2'. The fourth row contains '2', '1', '1', '1'. The fifth row contains '3', '2', '2', '2'.

Arrows indicate a path from the top-left cell (0,0) to the bottom-right cell (4,4):

- Orange arrows: (0,0) → (1,0) → (2,0) → (3,0)
- Green arrows: (1,0) → (1,1) → (1,2) → (1,3)
- White arrows: (1,0) → (2,1) and (3,2) → (4,3)
- Red arrows: (2,1) → (3,2) and (3,3) → (4,4)

Extensions

- Equal cost for insertions, deletions, substitutions not necessary (or even appropriate)
- Example: DNA contains “junk” (so-called introns)
- Insertions are expected in alignment

Smith-Waterman (1981)

$$s(n, m) = \max \left\{ \begin{array}{l} 0 \\ \max_{1 \leq i \leq n} \{s(n-i, m) - W_i\} \\ \max_{1 \leq i \leq m} \{s(n, m-i) - W_i\} \\ s(n-1, m-1) + \text{diff}(x[n], y[m]) \end{array} \right\}$$

- Measure of similarity instead of dissimilarity
 - $\text{diff}(x, x) > 0$
- Local alignment: Focus on regions with positive score

Smith-Waterman (1981)

$$s(n, m) = \max \left\{ \begin{array}{l} 0 \\ \max_{1 \leq i \leq n} \{s(n-i, m) - W_i\} \\ \max_{1 \leq i \leq m} \{s(n, m-i) - W_i\} \\ s(n-1, m-1) + \text{diff}(x[n], y[m]) \end{array} \right\}$$

Where is this used?

- Genome analysis for clinical use
 - Treatments
 - Drugs
 - Clinical trials
